

Rotliegend

Depositional Environments

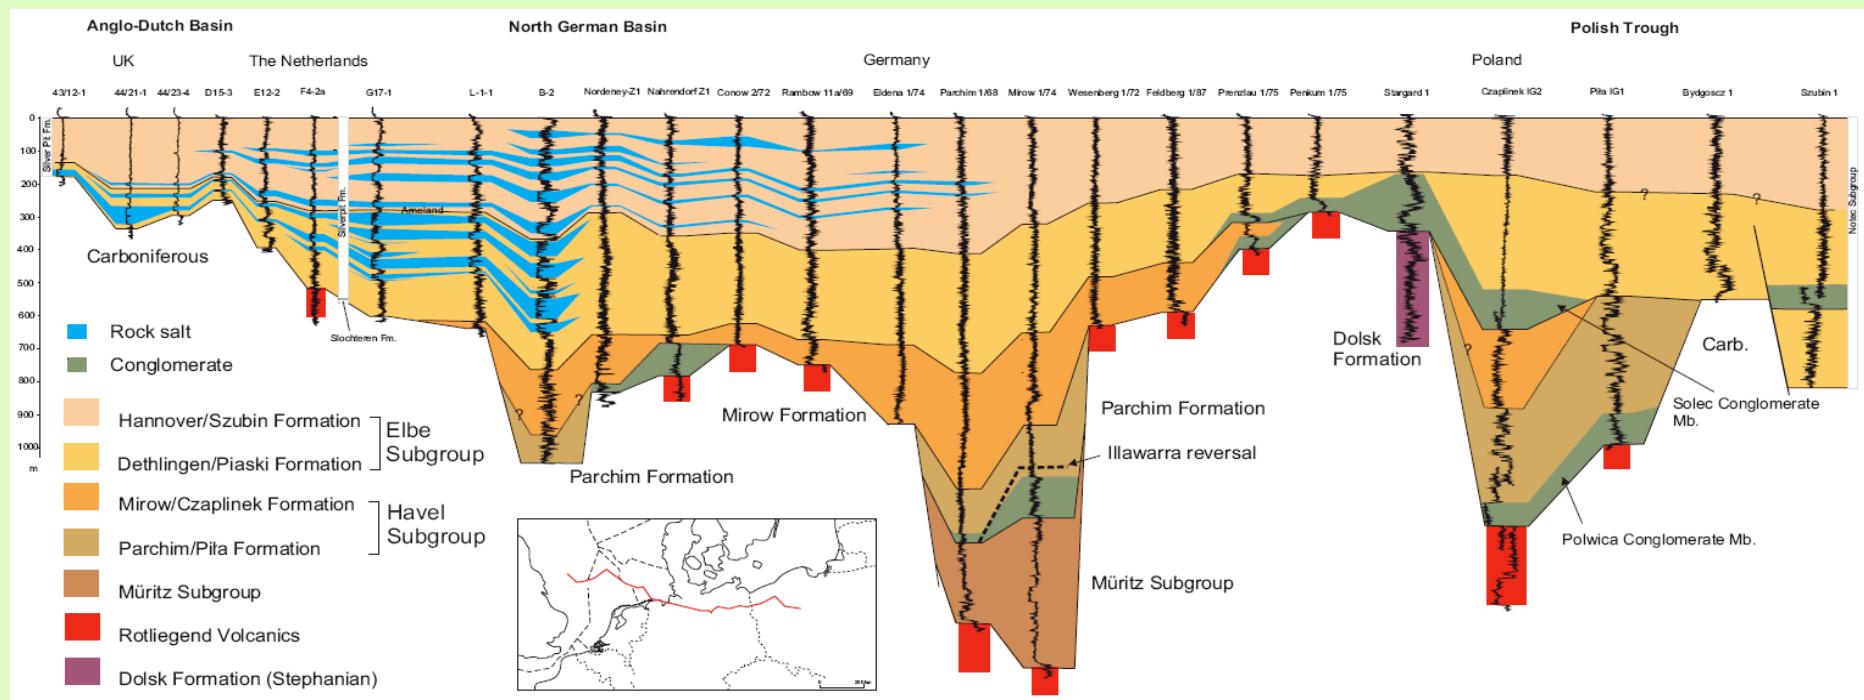

- an overview -

Reinhard Gaupp
University of Jena / Germany

Outline

- 1. Introduction**
- 2. Depositional evolution**
- 3. Control factors of sedimentation**
- 4. Lithofacies-Types, Cycles**

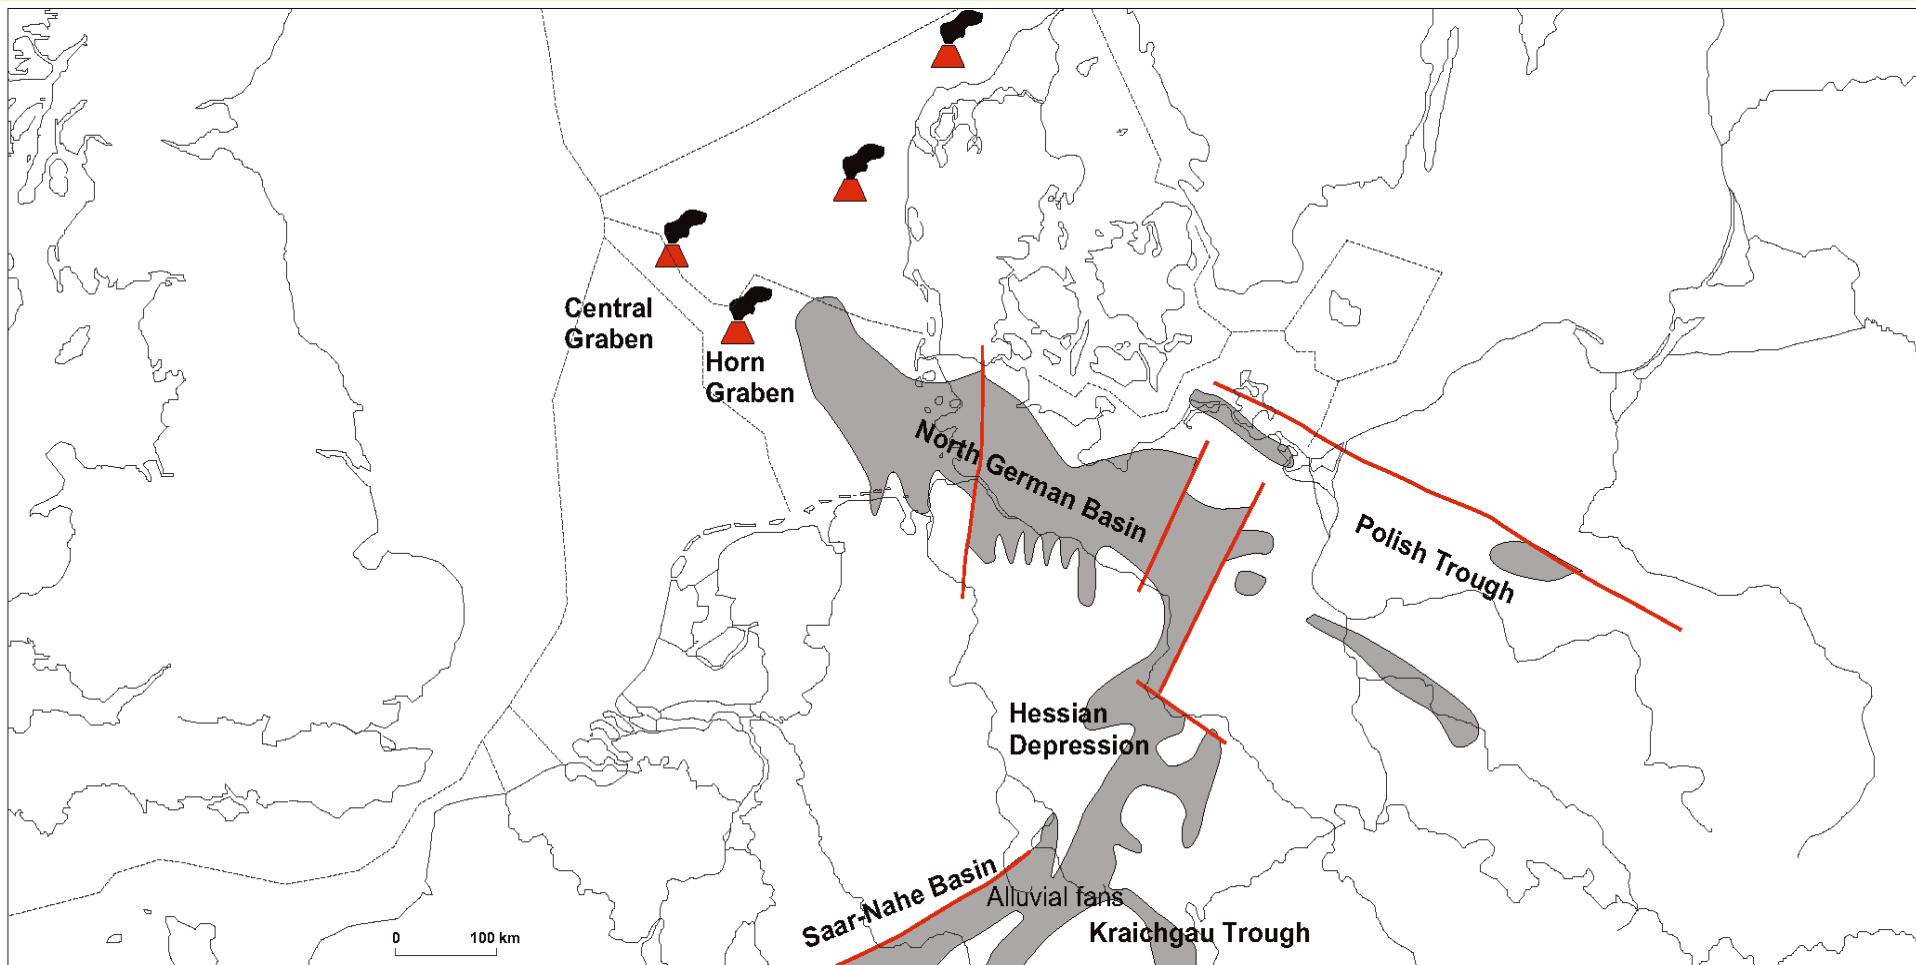

Rotliegend stratigraphic section CEBS W--E

Geluk (2005)

Rotliegend Paleogeography (oldest deposits)

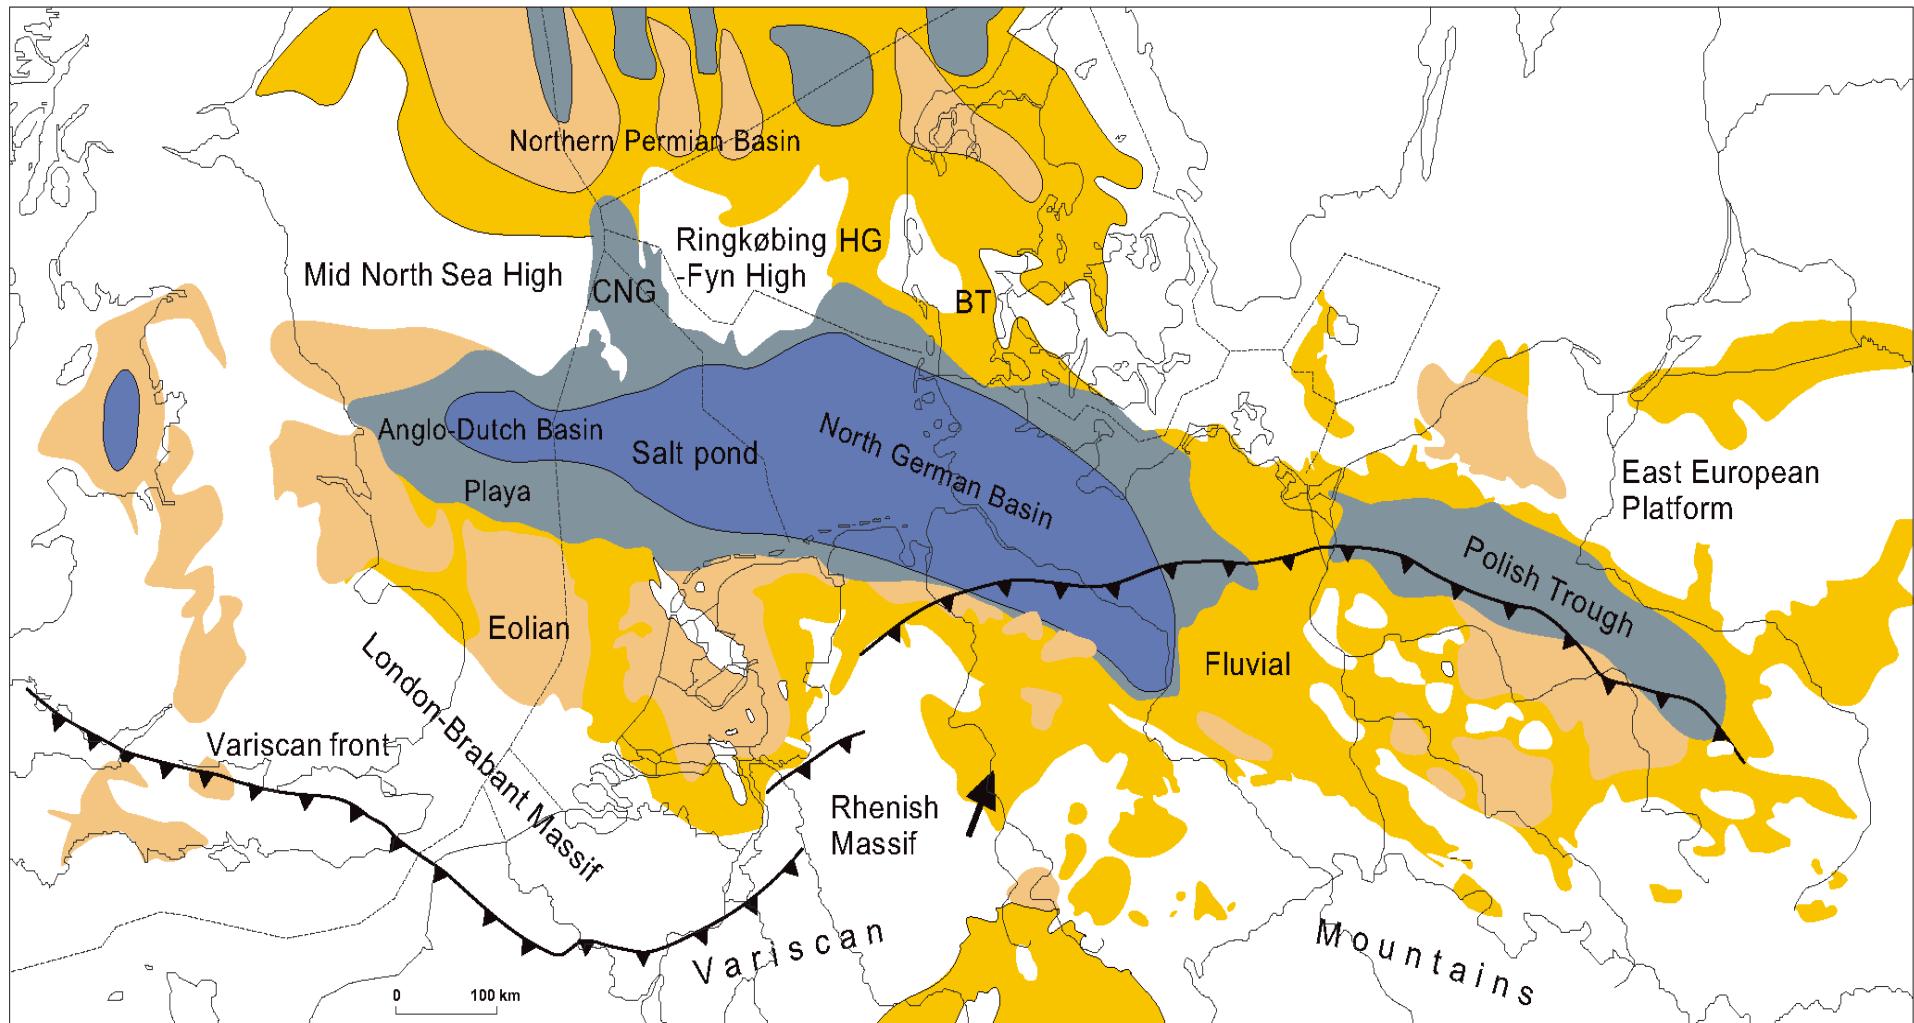

GELUK (2005)

Present-day distribution of the oldest part of the Rotliegend Sediments, the Müritz Subgroup (Mid Permian) and correlation units in Central Germany. The depositional facies include alluvial fans, fluvial, lacustrine and playa environments. Contemporaneous volcanism, indicated schematically, occurred in the Central, Horn and Oslo grabens. After Plein (1993, 1995) & Hoffmann et al. (1997)

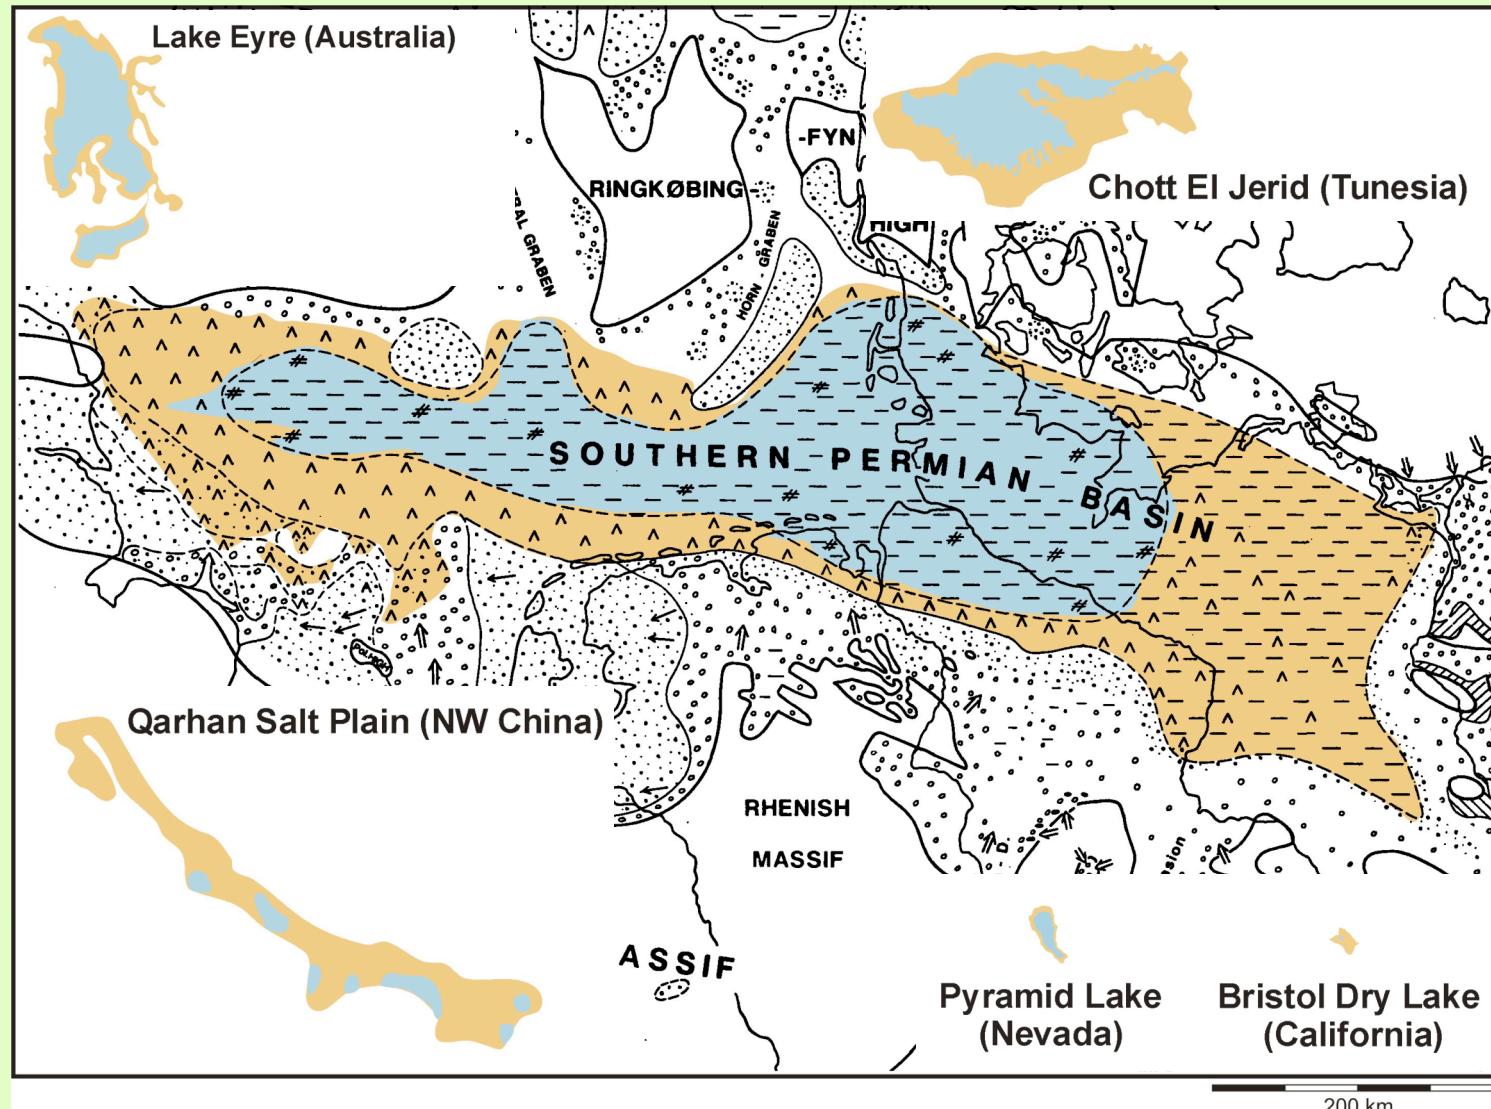

Rotliegend Paleogeography (Elbe Subgroup)

GELUK (2005)

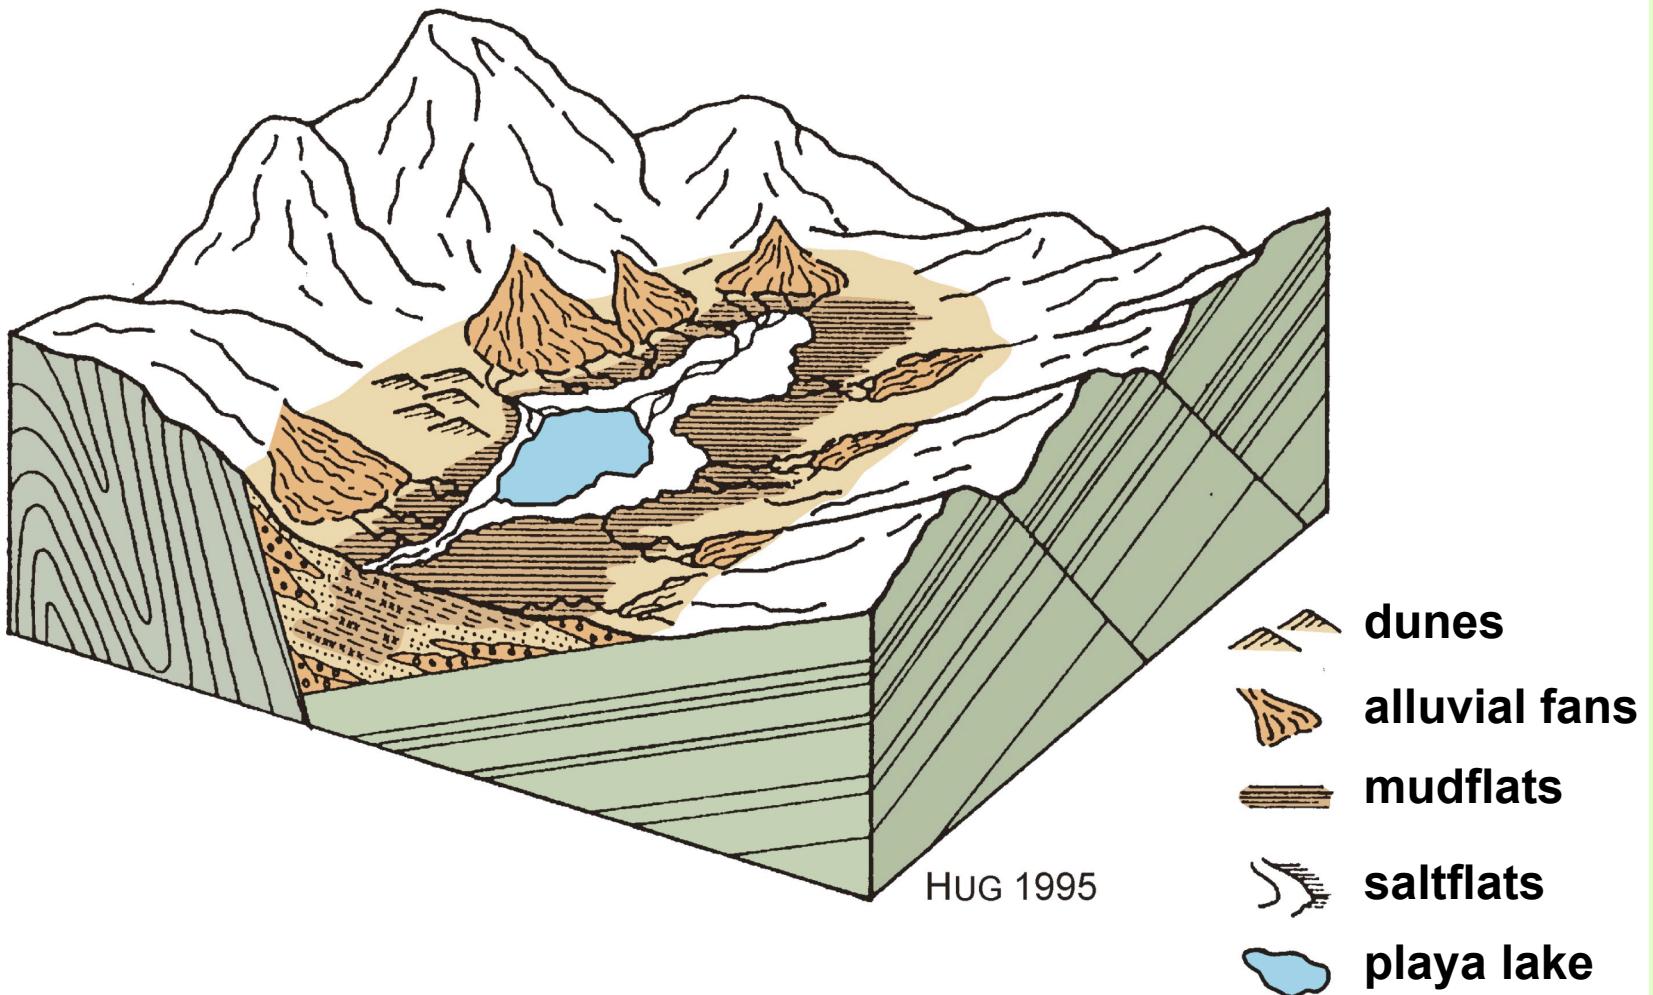

Facies and present-day distribution of the Elbe Subgroup of the Rotliegend Sediments. A large salt lake occupied the deepest parts of the Anglo-Dutch and North German Basins. CNG: Central North Sea Graben. After Sørensen & Martinsen (1987), Plein (1993, 1995), Hoffmann et al. (1997), Lokhorst (1998), Glennie et al. (2003).

Recent analogues for Late Rotliegend deposition?

"Fifty years of petroleum exploration in the Netherlands after the Groningen discovery" Utrecht 2009

The conventional Playa-Model

Recent surface analogues?

Caspi-Dardzha

Dry sandflats

Damp sandflats

Evap. mudflats

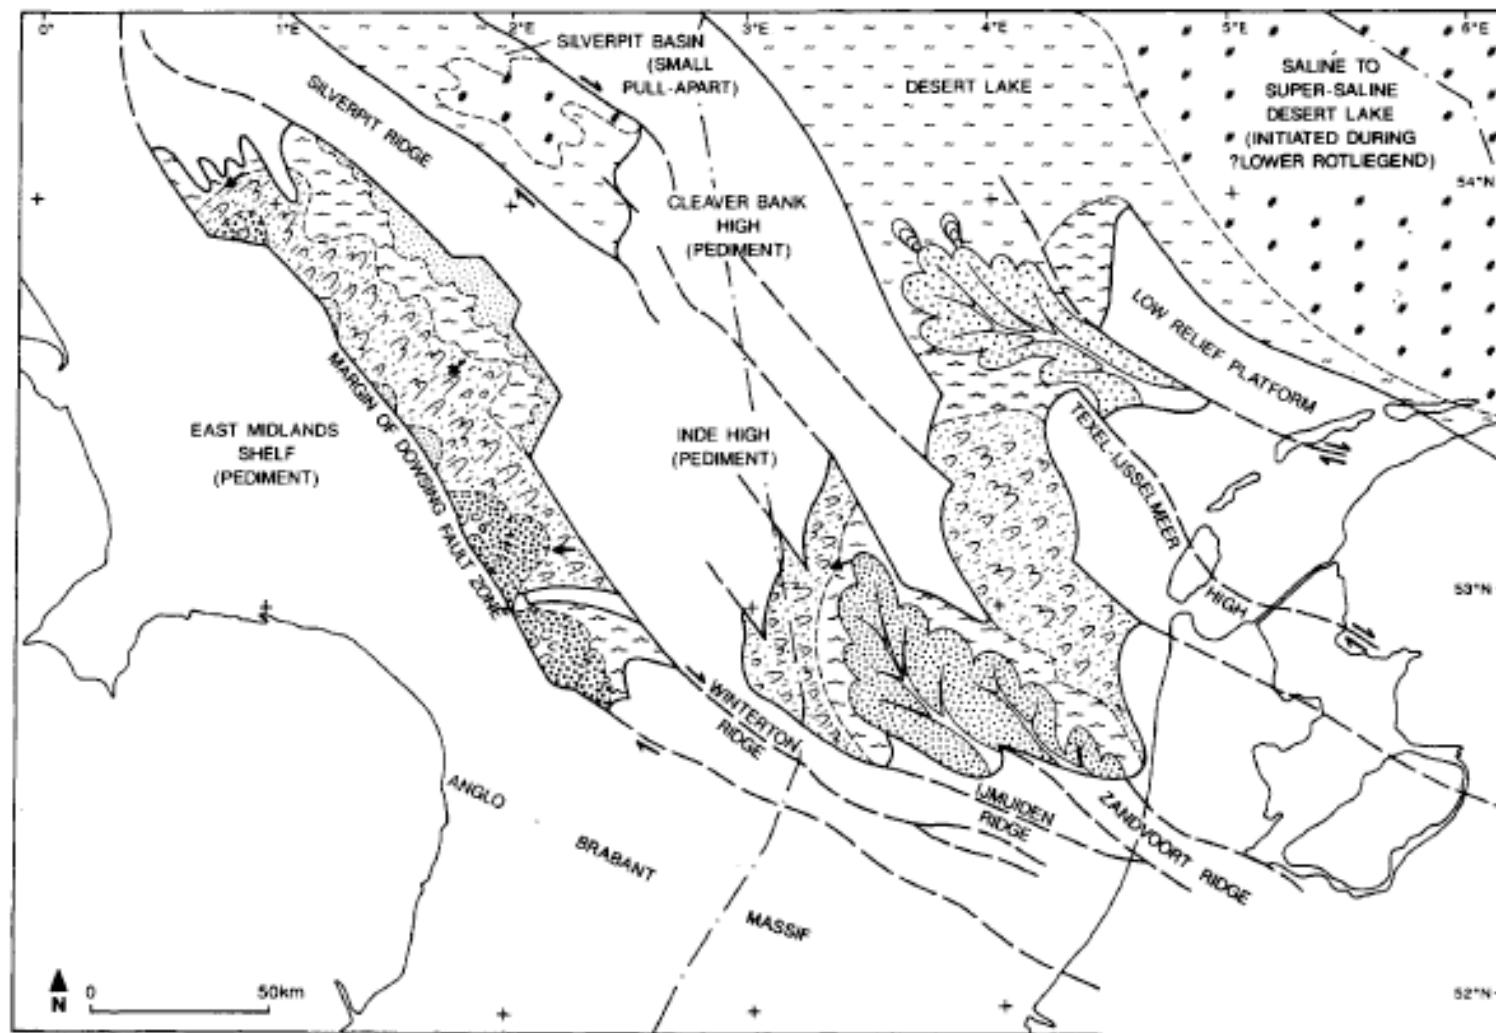

Major aspects of Rotliegend deposition

1. Synsedimentary tectonics locate Early Rotliegend deposition
2. From semi-arid to more humid conditions during Late Rotliegend (onlapping) deposition
3. Climate controls supply *and accommodation*
4. Terminal lake setting, underfilled basin

Depositional “structure-controlled facies patterns”

George & Berry 1997

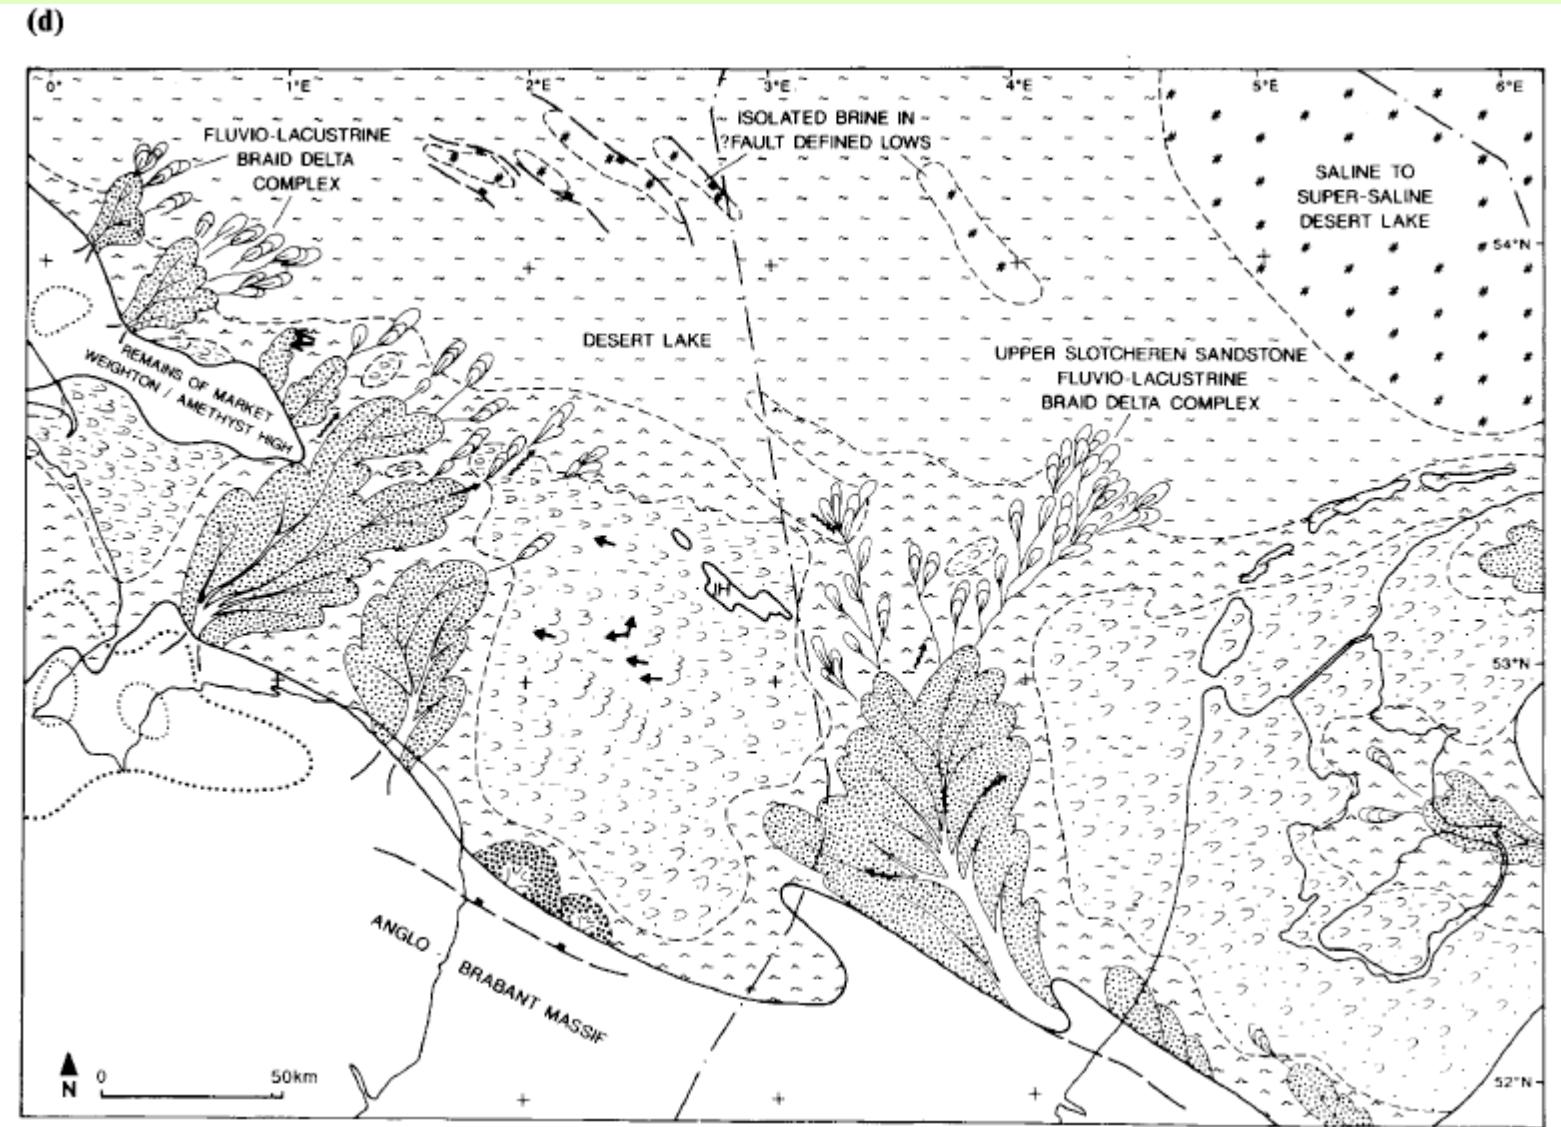

(a)

“Fifty years of petroleum exploration in the Netherlands after the Groningen discovery” Utrecht 2009

Depositional “supply-controlled facies patterns”

George & Berry 1997

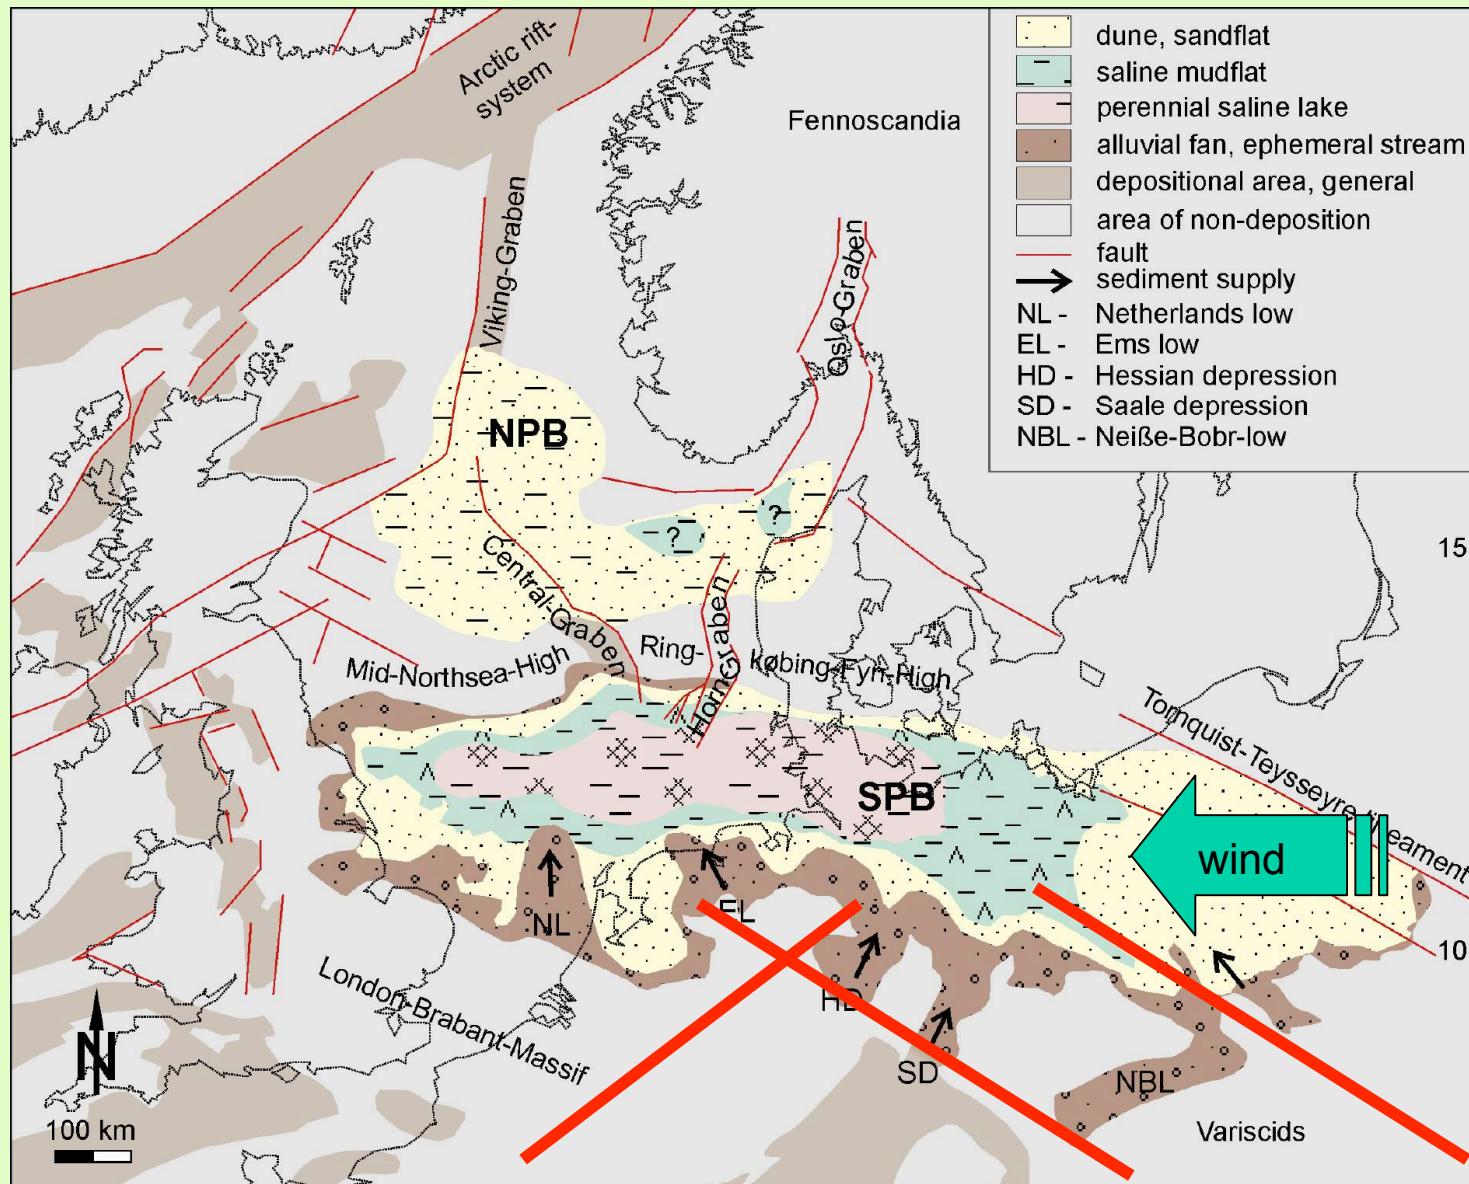

Sediment supply versus accommodation

1. Sediment supply

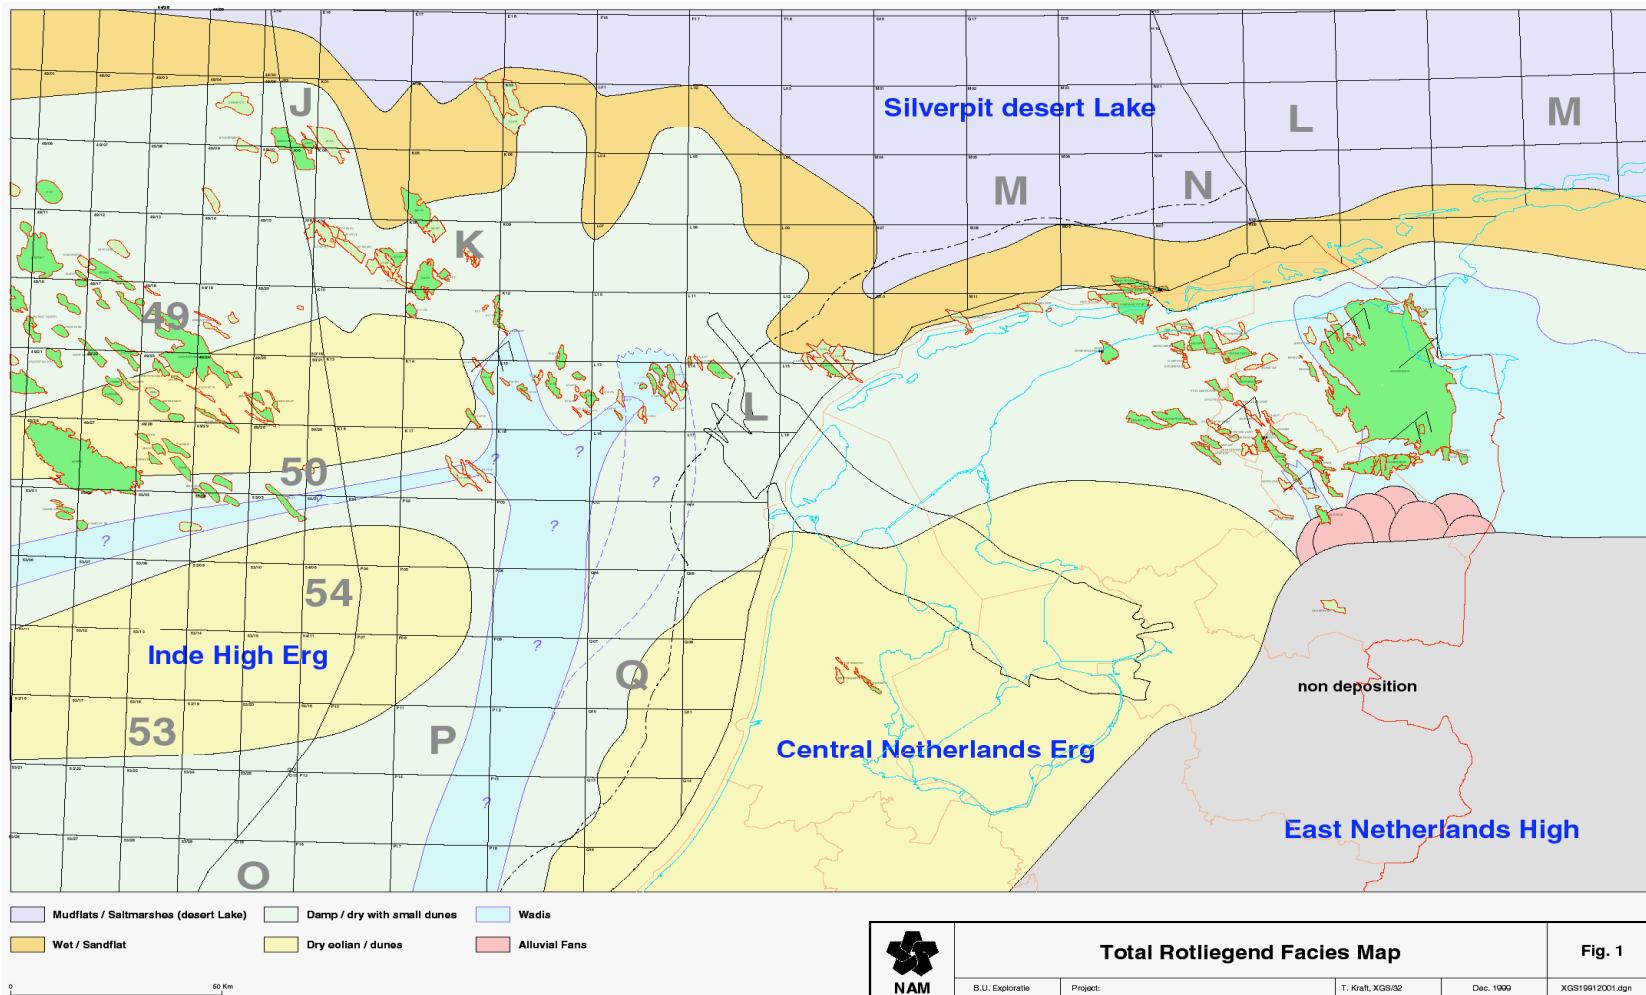

- supra-regional: aeolian clastics (quartz, fsp., mud)
- regional, local: alluvial / fluvial (often volcanic lithics)

Rotliegend Fluvial sediment supply, aeolian reworking

Legler 2008

Depositional “facies belts”

“Fifty years of petroleum exploration in the Netherlands after the Groningen discovery” Utrecht 2009

Sediment supply versus accommodation

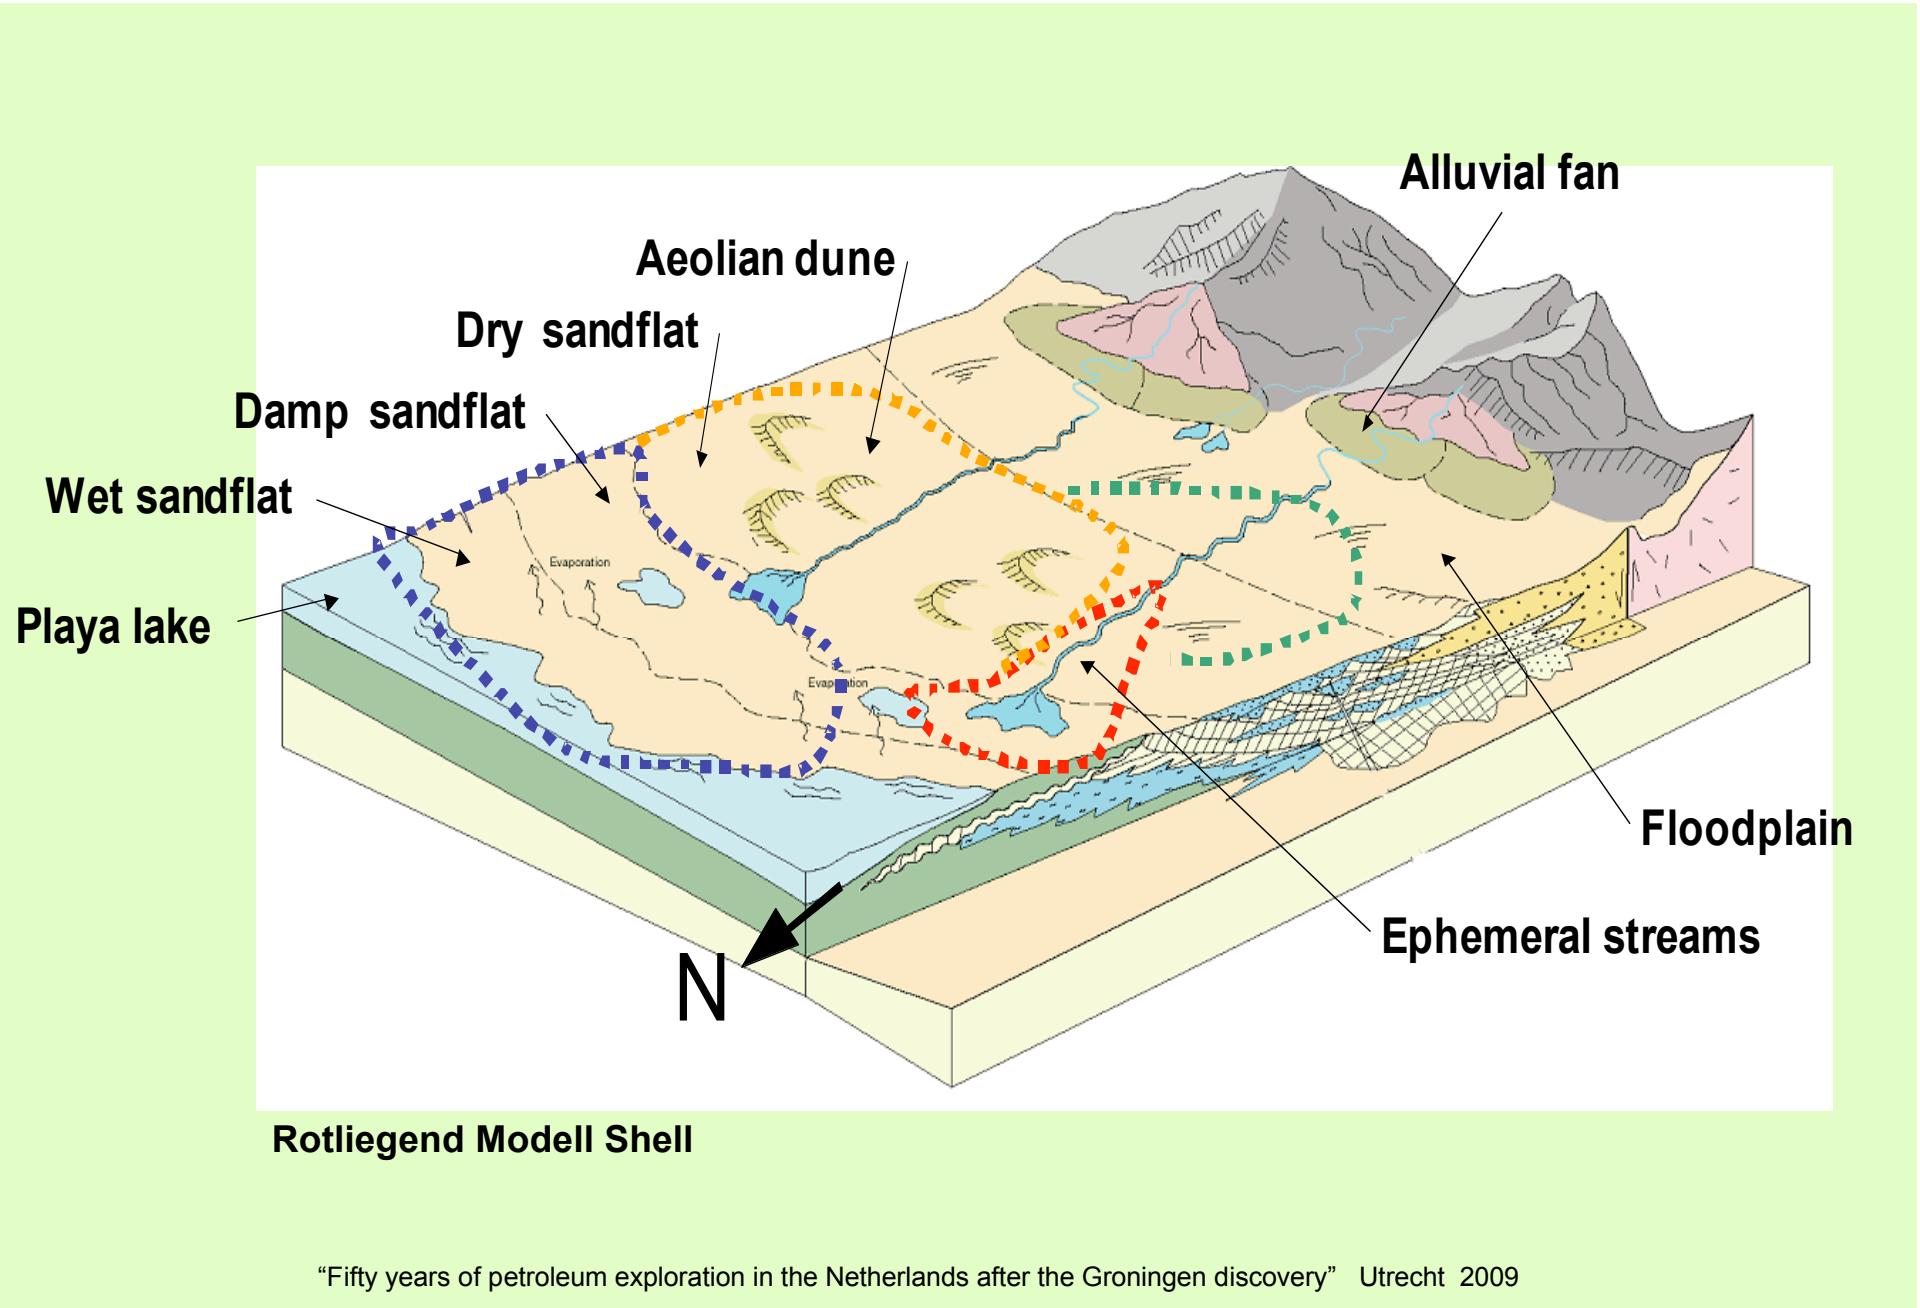

1. Sediment supply

- supra-regional: aeolian clastics (quartz, fsp., mud)
- regional, local: alluvial / fluvial (often volcanic lithics)

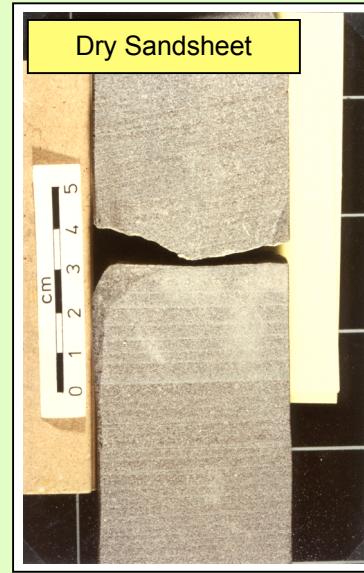

2. Accommodation and preservation of sediment

- basinal accommodation potential always in excess
- local preservation of sediment was highly variable, depending on groundwater position, salt efflorescences, deflation activity, flooding....

Rotliegend Depositional Environments

Basic groups of Lithotypes & (Sub)-Environments

Solms/
Baunack
in Gaupp et
al. (2004)

Damp Aeolian Deposition

Salar de Uyuni / Bolivia
