E&P investment climate in the Netherlands

The Netherlands has a longstanding, encouraging and supporting E&P investment climate that is now stronger than ever before. The Dutch government participates for 40% of the output from commercial fields. In addition, the Dutch government participates in developed fields, providing for 40% of the output from approved marginal fields. This participation level is consistent with the level of participation in the oil fields.

Tax relief for marginal gas fields and prospects

A project-specific tax relief is available to operators of a productive gas field or a group of fields. The relief is calculated as a percentage of the gross profit from the project. The percentage is determined by the government and is based on the level of development and the type of technology used.

Research, development and deployment

The Netherlands has a strong research and development sector, which is dedicated to the development of innovative and sustainable technologies. This sector is also involved in the development of marginal gas fields and the development of new technologies for the extraction of gas from these fields.
