Underexplored carbonate plays in the Netherlands

**A new chance for the Zechstein-2 Carbonates play**
- Presence around Elbow Spit High shown by wells and seismic
- Possible charge from Scremerston coals and/or Zechstein source rocks
- Cluster of leads with sizable volumes, nearby infrastructure

**Dinantian carbonates: from tombstone to cave**
- Wells and seismic data show potential for fractured/karstified reservoirs
- Cluster of leads straddling the UK-NL median line
- Close to existing infrastructure, in actively explored area
- Combine with Namurian clastics as secondary target

**The Chalk: A proven yet underexplored play**
- Oil production since 2001 (F2-Hanze), recent discovery (F17-10)
- >55 untested closures, >30 in open acreage
- STOIIP per lead 10–300 MMbbls
- Potential for intra-Chalk plays (Halfdan or Fife analogue)
